## Executive Summary

Virtual learning and personalized learning have been at the forefront of education reform discussions for over a decade. Backed by almost \$200 million philanthropic dollars from the Chan-Zuckerberg Initiative, the Gates Foundation, and others, Summit Public Schools has aggressively marketed its Summit Learning Platform to schools across the United States since 2015. As a result, the Summit Learning Program is now one of the most prominent digital personalized learning programs in the United States.

Summit Public Schools, an 11-school charter network operating in California and Washington, promotes its proprietary Summit Learning Program to potential “partner” schools as a free, off-the-shelf, personalized learning program. Summit’s marketing message trades on the alleged success of its schools. It claims to have developed a “science-based” personalized learning model of teaching and learning that results in all of its students being academically prepared for college. It further claims that its students succeed in college and are prepared to lead successful, fulfilled lives. These successes, it claims, are the result of its unique approach to personalized learning and the use of the digital platform at the heart of that approach.

None of the claims made by Summit Public Schools have been confirmed by independent evaluators. Other than scant bits of self-selected information provided by Summit Public Schools itself, we found no evidence in the public record that confirms its claims. Summit Public Schools has not provided the information related to its claims that we requested in a California public records request.

Despite the lack of evidence to support the claims made by Summit Public Schools, the Summit Learning Program has been adopted by nearly 400 schools across the country. While Summit has offered positive anecdotes and some selected data, there is no solid evidence that “partner” schools are experiencing the promised success. There are, however, a number of reports in the press that detail problems and dissatisfaction with the Summit Learning Program in partner schools and among students and parents. In addition, a Johns Hopkins University evaluation of partner school classrooms in Providence, RI, found students were left to teach themselves with minimal guidance from teachers and aides. Reviewers described students engaged in extensive off-task behavior and progressing slowly and ineffectively through their assigned work.

Our review of Summit partner school contracts suggests that student data collected by the Summit Learning Platform under the terms of those contracts presents a potentially significant risk to student privacy and opens the door to the exploitation of those data by the Chan Zuckerberg Initiative and possibly by unknown third parties—for purposes that have nothing to do with improving the quality of those students’ educations.

Virtual education and personalized learning are at the top of the education reform agenda in large measure because of hundreds of millions of dollars in funding and advocacy by philanthropic organizations (e.g., the Gates Foundation), large digital platforms (e.g., Facebook and Google), and venture capitalists anxious to access the school market. The COVID-19 pandemic has turbo-charged these efforts, as schools across the country are struggling to find safe ways to educate their students.

The rapid spread of the Summit Learning Program—despite a lack of transparency and the absence of convincing evidence that it can deliver on its promises—provides a powerful example of how policymakers are challenged when faced with a well-financed and self-interested push for schools to adopt digital personalized learning programs. There is now an urgent need for policymakers to move quickly to protect the public interest by establishing oversight and accountability mechanisms related to digital platforms and personalized learning programs.

We recommend that state departments of education establish an independent governmental entity responsible for implementing and enforcing the following recommendations to ensure the quality of digital personalized learning in public schools and to adequately protect the privacy of student data. Specifically, such an entity should:

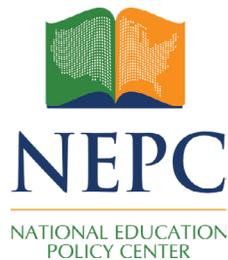

- Require that the digital personalized learning programs be externally reviewed and approved by independent third-party education experts. As part of these program evaluations, the evaluators should review and approve the program curricular materials, the pedagogical approaches as applied to the intended student populations, the validity of the assessment instruments, and the programmatic usefulness of data generated;
- Require that the assumptions and programming of all algorithms associated with personalized learning materials be audited for bias and other possible risks to students *before* the algorithms are implemented; and

- Develop a standard data security agreement that protects the privacy and limits the use of all data, including de-identified data, collected by schools through personalized learning materials and related software platforms.

## Introduction

For over a decade, schools across the United States have faced persistent pressure to adopt personalized learning programs. Nonprofit organizations,<sup>1</sup> state leaders,<sup>2</sup> the education and popular press,<sup>3</sup> government agencies, and foundations<sup>4</sup> have often promoted personalized learning and the adoption of digital technologies as complementary reforms. Advocates argue that tech-friendly personalized learning is a “student-centered” approach that will shift schools’ focus away from expecting all children to learn the same way at the same pace toward addressing each child’s individual needs and interests. In some instances the same reformers who have pushed for test-heavy, content-focused accountability systems are now, apparently without irony, promoting personalized learning as the cure for reforms they have spent the last two decades pushing on schools.<sup>5</sup>

The effort to install personalized learning in schools across the country has to a considerable degree been fueled by focused philanthropic funding (e.g., the Bill and Melinda Gates Foundation and the Chan Zuckerberg Initiative),<sup>6</sup> advocacy by tech industry trade associations<sup>7</sup> and large digital platforms (e.g., Facebook and Google), as well as investments by venture capitalists anxious to access the school market.<sup>8,9</sup> At the same time, many states have adopted policies that encourage the use of digital platforms in personalized learning programs by exempting these platforms from restrictions on data collection designed to protect student privacy.<sup>10</sup> Although personalized learning proponents argue that it is much more than the use of digital platforms, the conception of competency-based pedagogy underlying the most prominent personalized learning approaches requires extensive data collection and performance feedback that only digital platforms can offer.<sup>11</sup>

Despite years of promotion and advocacy, an agreed-upon definition of personalized learn-

ing remains elusive.<sup>12</sup> Moreover, there is as yet little research support to buttress the claims being made.<sup>13</sup> The RAND Corporation research that proponents often cite, for example, actually failed to find results that support the widespread adoption of personalized learning programs.<sup>14</sup>

RAND's research examined the effectiveness of the practices the Gates Foundation promoted as integral to personal learning.<sup>15</sup> While they found some positive effects on academic achievement in schools that adopted personalized learning practices, RAND researchers could not confidently say that those practices were the cause of the effects.<sup>16</sup> RAND researchers also were unable to find evidence that personalized learning practices have a distinct impact on non-academic skills such as creativity, collaboration, and communication (i.e., the “21<sup>st</sup>-century skills” thought to be promoted by personalized learning).<sup>17</sup>

In this advocacy, policy, and research context, Summit Public Schools (SPS), a charter school network operating in California and Washington, began in 2015 to market its “Summit Learning Program” to schools around the country as a research-based model of whole school personalized learning reform. On its Summit Learning website and in supporting white papers, SPS promoted its program to potential “partner schools.”<sup>18</sup> Supported by philanthropic funding, it offered them its proprietary competency-based digital platform, project-based learning approach, and mentoring approach at no charge.<sup>19</sup> SPS claimed that students in its schools learned to work independently, developed their cognitive and social-emotional skills, formed strong relationships with teachers, and succeeded academically both in its schools and subsequently in college.<sup>20</sup>

Since 2015, when it began marketing the Summit Learning Program (SPS refers to both the curriculum and instruction program that it uses in its schools and the program that it markets nationally to potential partner schools as “Summit Learning”) to schools outside its charter school network, SPS has repeatedly claimed that student success in its schools made SPS a model for others. In 2020, nearly 400 schools across the United States are using the Summit Learning Program, promoted since 2019 by a new nonprofit organization created by SPS, T.L.P. Education (doing business as “Summit Learning”).<sup>21</sup>

Given that research has not supported the claims of personalized learning advocates, it is important to understand whether and to what extent evidence supports SPS's claims that students at its schools—and by extension, at schools adopting the Summit Learning Program—will learn more and experience greater academic success. Its aggressive marketing and national footprint makes it important for policymakers to determine whether or not SPS, together with its long-term engineering partner, the Chan-Zuckerberg Initiative, and its philanthropic supporters (see Appendix A) have developed an approach to personalized learning that has delivered on its promises and will continue to do so.

## Studying Summit

Policymakers, district and school administrators, and communities have had little information other than marketing materials to use in evaluating the validity of claims about either SPS or its Summit Learning Program. For our analysis, we collected and analyzed publicly

available information to determine what evidence supported the outcomes reported by SPS. The information we reviewed included SPS and its Summit Learning Program websites, SPS reports, and other materials. We also examined reports and other documents related to SPS released by other organizations, stories in the education and popular media, funding data, state performance data, and SPS contracts with partner schools (see Appendix B for detailed description of our research methods).<sup>22</sup> We conducted weekly internet searches and regular monitoring of the websites and social media accounts of organizations that might provide information about SPS, the Summit Learning Program, personalized learning, and commercialism in schools (see Appendix B). We also submitted a California Public Records request to SPS (see Appendix C).<sup>23</sup>

SPS's leadership maintains a careful public face, and assiduously avoids providing more or different information than it has chosen to share as part of that public face. Our own experience researching SPS and Summit Learning offers a case in point. It also mirrors that of district officials and parents who have tried, with limited if any success, to obtain information about their schools' use of the Summit Learning Program.<sup>24</sup>

When we requested information from SPS directly, organization staff were unfailingly polite, but nonresponsive. They declined our initial request for an interview.<sup>25</sup> When we submitted our questions via a California Public Records Act (PRA) request, they declined to answer any

*It is notable that SPS has been so reluctant and, in many instances, unwilling to provide basic information about its educational program and platform.*

questions about the Summit Learning Program and the Summit Learning Platform, claiming that (1) activities relating to the Summit Learning Program and the Summit Learning Platform are not related to the operation of a SPS school and are therefore exempt from California's Public Records Act (PRA); and that (2) SPS can no longer access "certain records relating to the Summit Learning Program" (see Appendix C).

It is notable that SPS, a public charter management organization, has been so reluctant and, in many instances, unwilling to provide basic information about the educational program and platform that it created and has aggressively promoted to schools around the United States for several years. SPS provided information to us only as legally required and on the narrowest possible terms. It has even made the claim that the Summit Learning Program and Summit Learning Platform, created and used by SPS, have nothing to do with the operation of SPS (see Appendix C).<sup>26</sup>

In 2018-2019 SPS shifted the Summit Learning Program to T.L.P. Education.<sup>27</sup> T.L.P. is registered as a nonprofit organization and there is no legal mechanism by which the public can compel the organization to provide information, including about the intellectual property that SPS licenses (e.g., curriculum and brand). Nevertheless, both Diane Tavenner (the CEO of SPS) and Priscilla Chan (Co-Founder and CEO of the Chan Zuckerberg Initiative) are on T.L.P. Education's three-member board of directors. This suggests that these organizations are closely aligned. T.L.P. Education has not responded to any of our repeated written requests for information.<sup>28, 29</sup>

## Summit Claims of Success

Since 2015, Summit Public Schools (SPS) has marketed the Summit Learning Program as a response to the requests of schools outside its charter school network to share its recipe for success. The image of SPS and its Summit Learning Program as successful is cultivated on the SPS website and in documents such as the 2017 “white paper,” *The Science of Summit*.<sup>30</sup>

Despite its repeated claims of success and description of its curriculum and instruction program as “science-backed,” “evidence-based,” and “grounded in science,” SPS has declined to allow an independent evaluation of its curriculum and instruction program, including its proprietary digital platform, the Summit Learning Platform.<sup>31</sup> Stanford University professor Larry Cuban observed several SPS classrooms. In a series of posts he described teachers who were readily available and engaged in meaningful, competent interactions with students.<sup>32</sup> He also noted what he called strong “connective tissue” between SPS teachers and students, and teacher-mentors who were much more engaged with students than typical homeroom teachers.<sup>33</sup> However, such anecdotal reports provide no independent research validation of SPS’s claims related to the efficacy of the Summit Learning Program in general, or of the efficacy of the “Summit Learning Platform” in particular.

### Academic Performance

It is concerning that SPS offers only self-selected evidence to support its claims of success. A 2016 Progressive Policy Institute publication lauding Summit, for example, was based only on selected test performance data provided by Summit Public Schools (SPS) itself. These test data showed impressive results on California’s Academic Performance Index (API) and on a test of academic progress (MAP) produced by an organization called NWEA.<sup>34</sup> However, the API and NWEA MAP tests were only reported for one year for each set of tests (2012 for API and 2014-2015 for NWEA MAP).<sup>35</sup> SPS has also created case studies of selected partner schools to demonstrate their success with the Summit Learning Program.<sup>36</sup> While of interest, self-created case studies do not provide evidence of the systematic efficacy of the Summit Learning Program in the many partner schools that have adopted it.<sup>37</sup>

In 2017, as part of a larger study of charter school students’ growth in state math and reading scores, the Center for Research on Education Outcomes (CREDO) included a snapshot of the performance of 398 SPS students for the 2012-2013 school year. CREDO found that attending SPS had a small but significant negative impact on math scores and no significant effect on reading scores.<sup>38</sup> SPS, however, claims that standardized tests are not a valid way of assessing the cognitive skills that it values.<sup>39</sup> At the same time, SPS has not provided independent research evidence to support its claims that its students excel in the development of cognitive skills.

### Career and College Readiness

Summit Public Schools (SPS) has emphasized its graduates’ readiness for 4-year college, claiming that 100% of its students are “eligible for 4-year college.”<sup>40</sup> This claim does not

seem plausible, given the graduation rates published by the California Department of Education (CDE) and the Washington Office of Superintendent of Public Instruction, and the college readiness data published by the CDE and the Washington Charter School Commission.

According to California and Washington state records, no school in the SPS charter school network has ever graduated 100% of its senior class. Since its first graduating class in 2006-2007, SPS four-year graduation rates have ranged from a low of 75% (Summit Rainier in 2014-2015 and Summit Olympus in 2017-2018) to a high of 98.9% (Summit Prep in 2007-2008) (see Appendix D).<sup>41</sup>

CDE calculates the percentage of high school graduating students it determines to be ready for college and career.<sup>42</sup> It determines graduates to be “prepared” for college/career if they attain one of the following:<sup>43</sup>

1. Pass the Grade 11 Smarter Balanced Summative Assessments in English Language Arts (ELA)/literacy and mathematics with a score of 3 or higher;
2. Pass two Advanced Placement (AP) exams with a score of 3 or higher;
3. Pass two International Baccalaureate (IB) exams with a score of 4 or higher;
4. Receive a State Seal of Biliteracy and pass the Grade 11 Smarter Balanced Summative Assessment in ELA with a score of 3 or higher;
5. Pass the “a-g” courses required to apply to schools in the University of California or California State University systems with C minus or better and complete one of the following: pass Smarter Balanced Summative Assessments with a Level 3 or higher in ELA and at least a Level 2 in mathematics, or Level 3 or higher in mathematics and at least a Level 2 in ELA; complete one semester/two quarters/two trimesters of College Credit Courses with a grade of C- or better in academic/career and technical education (CTE) subjects where college credits are awarded for each course; score of 3 on one AP exam or score of 4 on one IB exam; or complete a CTE Pathway;
6. Complete a Career Technical Education (CTE) pathway and complete one of the following: pass Smarter Balanced Summative Assessments with a level 3 or higher in ELA and at least a level 2 in mathematics, or level 3 or higher in mathematics and at least a level 2 in ELA; or complete one semester/two quarters/two trimesters of College Credit Courses with a grade of C- or better in academic/CTE subjects where college credits are awarded for each course;
7. Complete two semesters, three quarters, or three trimesters of college coursework with a grade of C- or better in academic/Career Technical Education subjects where college credits are awarded;
8. Complete two years of Leadership/Military Science, score of Level 3 or higher in ELA and math, and Level 2 “Standard Nearly Met” or higher in other subject area.

This is a complicated system; any given student can potentially qualify in a number of dif-

ferent ways.

We examined the most recently released (2018-2019) college/career readiness percentages for the five SPS schools in California with a graduating class (Summit Everest, Summit Prep, Summit Rainier, Summit Shasta, and Summit Tahoma) to determine what might be said about the college/career readiness status of SPS students in general.

The percentages of SPS students the state of California recognized as “prepared” on its measures of college/career readiness fell well short of the 100% that SPS continues to claim,<sup>44</sup> ranging from from 56% (Summit Everest) to 74% (Summit Shasta)<sup>45</sup> (See Appendix E). In addition, by a wide margin, SPS students demonstrated readiness by completing the coursework making them eligible to apply for admission to CA state universities rather than by any of the other possible means.

In 2018-2019, between 92% (Summit Prep) and 98% (Summit Tahoma) of SPS students who qualified for the readiness designation did so by satisfying the high school coursework metric (see Appendix E). Across Summit Public Schools’ (SPS) five California schools with a high school graduating class in 2018-2019, 329 of the 505 graduating students qualified as “prepared” according to California’s college/career readiness calculations.<sup>46</sup> Of those 329 “prepared” students, 315 qualified as prepared by passing the coursework required to make them eligible to apply for admission to California’s public universities; 181 passed Smarter Balanced Assessments with scores of 3 or higher in both ELA/literacy and mathematics; and 80 students scored 3 or higher on two Advanced Placement tests. In other words, SPS students are qualifying as “prepared” much more by completing high school coursework that SPS designs and grades than by performing at high levels on external measures of academic performance.<sup>47</sup>

The same is true for SPS’s Washington schools. The Washington State Charter School Commission’s Performance Framework Reports for 2018-2019 included data relevant to a college readiness goal that SPS set for itself and that the state of Washington does not report for all its schools<sup>48</sup>: “90% of students [will] finish the year college ready by scoring at least a 70% or higher in all classes,” and “at least 50% of students [will] exceed basic college readiness by scoring 85% or higher in all classes.”<sup>49</sup> In 2018-2019, all the SPS Washington schools achieved their goal (see Appendix E).<sup>50</sup> By including all students, not only those graduating, this measure of readiness indicates how many of each SPS school’s students were on track to graduate college-ready. And, notably, it also allows SPS to define college readiness based not on any kind of commonly agreed-upon metric, but rather on the cognitive skills that SPS itself defines, assesses, and measures.<sup>51</sup>

There is nothing inherently invalid about SPS students being declared prepared based on their successful completion of their high school coursework. SPS determines students to have successfully completed their coursework based on teachers’ evaluations of whether they demonstrate mastery of the cognitive skills that SPS has defined (See Appendix F). This being the case, it is essential that the rubric that SPS uses to assess its students’ cognitive skills be both valid and reliably used by teachers.

We could find no publicly available documentation of the validity or reliability of the Sum-

mit Public Schools (SPS) Cognitive Skills Rubric.<sup>52</sup> The Stanford Center for Assessment, Learning, and Equity (SCALE), which ostensibly worked with SPS on both an earlier and updated version of the Cognitive Skills Rubric, referred us to SPS for information about it (See Appendix G). SPS has not provided records we requested that (1) explain the basis for and/or that document the psychometric validation of the Cognitive Skills Rubric, (2) describe the training of teachers to use the Cognitive Skills Rubric, and (3) demonstrate teacher training's effect on teacher consistency in assessing student mastery of cognitive skills (See Appendix C). As a consequence, although Summit Public Schools' (SPS) claim that its students are college ready is technically correct, the overwhelming majority of those students meet the standards by taking SPS's courses and being evaluated by SPS's rubric. Given that Summit Public Schools (SPS) has provided no evidence that its Cognitive Skills Rubric has either internal or external validity, and that there is no evidence that student mastery of the cognitive skills detailed in the rubric is reliably assessed, the claims made by SPS related to its success in preparing students for college are without support and cannot be taken at face value (See Appendix G).

## **Success in College**

Summit Public Schools (SPS) claims on its website that, "From our inaugural graduating class until now, 98% of all Summit graduates have been accepted into at least one four-year college" and that its students graduate at "2X the national average for college graduation."<sup>53</sup> We could find no data to confirm or disconfirm these assertions. When we asked in an open records request, SPS claimed to have no records relevant to these claims (see Appendix C).<sup>54</sup> This is consistent with the pattern described above, of SPS making extreme claims about its students' success and then being unable or unwilling to provide documentation to support those claims (see Appendix G).

## **Marketing Summit Public Schools**

Given the lack of supporting data in the public record for Summit Public Schools' (SPS) claims of effectiveness and its inability and/or unwillingness to provide evidence to support its claims, SPS's success in convincing others to adopt its program based on its alleged success is astounding. This suggests that its ability to successfully market its program to schools across the country rests not on the efficacy of the Summit Learning Program so much as on millions of philanthropic dollars, guidance, and other support of such backers as the Gates Foundation. These well-heeled backers have funded a comprehensive and aggressive marketing campaign that promises underfunded U.S. schools struggling to provide a high-quality education that they will be provided—without cost—a successful personalized learning program.<sup>55</sup>

Early on, SPS promoted itself<sup>56</sup> to potential funders, particularly funders associated with the technology industry who might support the charter school network as a "laboratory of innovation" that featured the use of digital technology and could spearhead further adoption of such technology.<sup>57</sup> Armed with philanthropic cash, SPS targeted parents, teachers, and

administrators of potential partner schools.<sup>58</sup>

A 2015 agreement between Summit and Facebook established the goals of developing and enhancing Summit’s existing platform software and collaborating on marketing strategy for its nationwide adoption.<sup>59</sup> A June 2017 SPS final report to the Chan Zuckerberg Initiative (CZI) outlined public relations efforts to create social conditions amenable to widespread adoption of personalized learning.<sup>60</sup> The report described the marketing efforts as part of a strategy to create “one consistent narrative” promoting a positive answer to the question of “Does Summit Learning work?”

Part of this marketing strategy was the 2017 publication *The Science of Summit*, which purports to show that SPS’s pedagogical approach is research-based.<sup>61</sup> In the earlier 2017 CZI grant report, SPS lists plans to promote *The Science of Summit* through an in-depth blog series, a podcast series, a Facebook live series, as well as brochures, presentation slides, infographics, and slideshows—all of which SPS planned to complement with efforts to “build trust and advocacy among our audiences by engaging with key influencers who they respect and turn to for insights and opinions.”<sup>62</sup>

*The Science of Summit*, in fact, offers no research evidence of the positive effect of SPS’s program on student performance.<sup>63</sup> Rather, it describes choices SPS made as it developed its approach—to focus on project-based learning and generalized “cognitive skills,” noncognitive, social-emotional factors, and student-teacher relationships. It points to a historical context of research and theory that it interprets as consistent with these choices. These theories and research would, however, also support choices leading to very different programs of curriculum and instruction. For example, rather than having students independently learn the content knowledge necessary for a given project as part of a digital competency-based learning approach, as SPS does, a different approach might have a class start a project by determining as a group the kinds of knowledge or skills they would need in order to complete the project, and how they might acquire them. In such an approach, the discussion and choices related to gaining the necessary knowledge are central to the project, not separate.

*“The Science of Summit” offers no research evidence of the positive effect of SPS’s program on student performance.*

Given that theory and research can lead to a variety of implementations and the fact that there has been no external research confirmation of the efficacy of Summit’s practices, *The Science of Summit* cannot be regarded as providing research validation of the Summit Learning Program.

*The Science of Summit* resembles Summit’s other marketing materials in emphasizing the non-digital aspects of the program. On their websites, both SPS and Summit Learning avoid the words “computer,” “digital,” and “platform.” The words “self-directed” and “self-direction” take their place, next to “mentoring” and “projects” (and, in the case of SPS, but not Summit Learning, “expeditions”).<sup>64, 65</sup> Although the Summit Learning Platform is the central organizer, delivery tool, and data hub for Summit’s approach to personalized learning, Summit’s marketing materials de-emphasize its role. When the platform is mentioned at all, it is characterized as a feature that supports both teachers and students in their efforts to create graduates who know how to learn independently, who will attend, succeed, and graduate from college, and who will develop the personal and academic skills they will need to lead fulfilled lives.<sup>66</sup>

## **A Flood of Philanthropic Dollars**

Since 2011, Summit Public Schools (SPS) has received philanthropic funding totaling at least \$177.6 million.<sup>67</sup> Donors include the Bill and Melinda Gates Foundation, the Carnegie Corporation of New York, the Silicon Schools Fund, the Silicon Valley Community Fund, Meg Whitman, and the XQ Institute (see Appendix A). The *Hechinger Report* reports that the Chan Zuckerberg Initiative (CZI) alone committed \$142.1 million to SPS since 2016.<sup>68</sup> CZI's website reports providing \$48.8 million to SPS between 2016 and 2020 and \$40 million to T.L.P. Education between 2018 and 2020 (see Appendix A).<sup>69</sup> These financial contributions do not include significant in-kind contributions made by Facebook (and possibly CZI as well) to develop the Summit Learning Platform and the marketing strategy for the Summit Learning Program.<sup>70</sup> They also do not include additional financial contributions made to Summit partners, such as the Lindsay Unified School District.<sup>71</sup>

Together, the influx of money, engineering skills, and business know-how from the digital technology sector and tech-friendly foundations supercharged the development of the Summit Learning Platform and made possible the widescale sophisticated marketing program of the Summit Learning Program.

By the 2019-2020 school year, the SPS charter school network had grown to 11 (from two in 2010-2011) and the number of Summit Learning partner schools had grown from zero in 2013-2014 (prior to its partnership with Facebook) to over 380.

## **The Enduring Lure of “Free” Whole-School Reform**

Public schools have for years been flooded with marketing materials promoting personalized learning even as they have been criticized, often unfairly, for using an outdated “factory model” of curriculum and instruction. They are guilty, critics assert, of failing to equip their students for success in 21<sup>st</sup>-century workplaces and lead satisfying fulfilled lives.<sup>72</sup> Personalized learning programs, including the Summit Learning Program, offer the promise that students at schools adopting them will be equipped with the skills that modern workplaces demand; that teachers will be freed from mundane tasks so they can mentor students; and, that student achievement and life competence will improve.

Marketed as a cost-free solution to the academic problems faced by cash-strapped districts,<sup>73</sup> the Summit Learning Program promises an off-the-shelf system of whole-school reform that will transform struggling schools into successful schools. Such a promise cannot help but appeal to school and district decision-makers. Unfortunately, the recent history of whole-school reform models suggests that the results are likely to be disappointing.

In the 1990s, the New American Schools Development Corporation (NASDC), a privately funded organization, supported the development and implementation of whole-school reform models as part of both President George H.W. Bush's (“America 2000”) and President Clinton's (“Goals 2000”) education reform efforts. In the 1990s NASDC funded a number of school reform models that would appear to meet the criteria that Summit deems essential (i.e., they were internally consistent and supported by sound research). The implementa-

tion of NASDC models foundered in part because schools adopting the models could not, by themselves, afford either the cost of implementing them or of sustaining them—or both. Unsurprisingly, then, another significant issue was that school staff were not provided with adequate training in implementing the models and/or with ongoing in-service support.<sup>74</sup>

Similar problems have cropped up among partner schools adopting the Summit Learning Program, detailed in several reports of schools failing to achieve anything like the promised success.<sup>75</sup> SPS tends to characterize these failures as a result of partner schools having improperly implemented its program, or as non-representative.<sup>76</sup> If this is indeed the case, it would not be surprising: even though the program itself is provided without charge, the model imposes costs on schools that most schools likely cannot afford, including costs associated with providing the required digital infrastructure and devices. Further, even if staff use the Summit Learning Program “off the shelf,” it is possible that schools may be unable to provide the level of staff training and ongoing in-service support to properly implement or maintain the model.

The SPS model developed in a particular context under a particular set of conditions in a small number of low-enrollment schools in California and Washington state. It is not clear that whatever successes SPS may have had in its own schools can be abstracted into a guiding set of principles for widespread school reform, particularly for schools serving low-income communities with diverse student populations. Between the Summit Learning Program’s initial launch in 2015-2016 and 2018-2019, SPS reported that 393 schools contracted to use the Summit Learning Program.<sup>77</sup> A *Chalkbeat* analysis found that about 25% of the schools that adopted it before the 2018-2019 school year dropped out along the way.<sup>78</sup> Whether and to what extent the remaining schools have held true to the model—as well as what results they have experienced overall—is unknown.

*It is not clear that whatever successes SPS may have had in its own schools can be abstracted into a guiding set of principles for widespread school reform.*

Whether and to what extent the remaining schools have held true to the model—as well as what results they have experienced overall—is unknown.

When schools adopt the Summit Learning Program, they will predicably face a number of challenges. An outside source provides a completely new philosophy, curriculum, and digital platform, and along with them a vast set of unfamiliar tasks.<sup>79</sup> Given these many new and different demands on teacher time, it is not hard to imagine that the framework of the program, the digital Summit Learning Platform, is likely to be privileged over the other program features as partner school staff struggle to keep up. That is, more teacher time must be spent on tasks related to the platform, crowding out the time that they theoretically would be spending on student-facing activities such as mentoring and supporting student projects.<sup>80</sup>

Schools that face the greatest financial challenges, that are understaffed, and that support large numbers of students with special needs are likely to find even the demands of learning and mastering an ever-changing platform beyond their capabilities. A Johns Hopkins University team found just such a situation when it reviewed Summit Learning Program classrooms in Providence, RI, in 2019.<sup>81</sup> The reviewers found students in Summit Learning Program classrooms proceeding slowly through the program’s curriculum, trying to guess their way through material with minimal teacher supervision.<sup>82</sup> These students were more disengaged and off-task than students in traditional classrooms in the same district, and

they were limited to learning how to answer problems in the program’s assessment format.<sup>83</sup> Students reported disliking the program and being “burned-out” by extensive screen time.<sup>84</sup>

In practice, it appears that in partner schools the Summit Learning Program can often leave children to teach themselves, which means that students in schools like those in the Providence district may not master the curriculum or have other meaningful learning experiences. As we have already noted, whereas SPS portrays its approach as scientific and generalizable, the culture created over time in SPS is the unique result of its history and development. It would be hard, if not impossible, to transfer this culture to disparate partner schools.<sup>85</sup> What *can* be used, no matter how imperfectly, however, is the digital Summit Learning Platform. And, in contrast to the images conjured up by personalized learning advocates, the Summit Learning Platform operationalizes a data-hungry, hyper-rational, competency-based approach to learning.

## Data Collection and Use

The Summit Learning Platform collects a lot of data about students from partner schools. It obtains some of these data—such as English Language Learner information, school attendance information, state assessment data, and bus pickup and drop-off locations—from school data systems as part of Summit Learning’s role as a “school official.”<sup>86</sup> It gets other data—such as project grades, student goals, and mentoring notes—when teachers and students voluntarily enter them. It collects still other data automatically as students work within the platform. Among these are such details as students’ content assessment attempts and results, times and locations of activity, and IP addresses. Data are used as part of the educational program, to improve it, and to market it. It is not clear to what other purposes the data may be put.

The contracts signed with Summit Public Schools (SPS) (and, since 2019-2020, with T.L.P. Education) that we reviewed are careful to distinguish personally identifiable “student data” and “de-identified data.” The contracts set limits on the use of “student data.” For example, they prohibit the sale of “student data” and its use for purposes other than to provide the services specified in the contract. They also provide for SPS (and, since 2019-2020, T.L.P. Education) to “destroy” “student data” by de-identifying it. This means that when schools, as allowed by their contract, request that data collected from their students be destroyed, it may not actually be destroyed in the sense that most people understand the term. Rather, it may be transformed into de-identified data.

The contracts we examined permit SPS (and now T.L.P. Education) access to and use of de-identified student data in perpetuity. Contracts signed in 2018-2019 explicitly provide for SPS (and now T.L.P. Education) to use de-identified student data “for any lawful purpose” (the same language appears in the current Data Privacy Addendum on the Summit Learning website).<sup>87</sup> By extension, this means that the Chan Zuckerberg Initiative (CZI), its long-term technology partner,<sup>88</sup> may also access de-identified student data to use in any way it wishes in perpetuity. Uses may include analyzing it for insights about student learning and psychology using big data statistical methods, selling it to third parties, and creating

for-profit enterprises to exploit it—all without the knowledge and consent of either students or their parents.<sup>89</sup>

The privacy protections we reviewed in SPS’s contracts with partner schools seem impressive on their surface; however, the provisions related to de-identified data are telling. SPS assures partner schools that it will not re-identify the data. However, this is far from the whole picture. Clause 4.6 of the Data Privacy Addendum to the 2018 contract(s) we reviewed provides for (personally identifiable) student data to be de-identified as a means of “destroying” it, and exempts de-identified data from the obligation to destroy data.<sup>90</sup> This is important because the data never have to actually be destroyed, and they can be re-identified. Computer scientists and data experts have known for years that complex de-identified datasets—such as the student datasets held by SPS—can easily be re-identified.<sup>91</sup> There can be little doubt that contract language related to the “destruction” of data was crafted with full knowledge that de-identified data can be easily re-identified and thus are not in fact “destroyed.” In effect, the contract gives CZI access to student data, and it may do whatever is legally permissible with those data, in perpetuity.

It is important to note that the Chan Zuckerberg Initiative (CZI) is not a charity or a philanthropic organization: it is a business.<sup>92</sup> As such, it can make political contributions. It can and does make charitable contributions. It can and has invested in several for-profit companies,<sup>93</sup> and it can and has engaged in political lobbying.<sup>94</sup>

Given this background, it would be reasonable to assume that CZI expects some gain from its collaboration with SPS and now T.L.P. Education. It also seems likely that what it stands to gain is access to significant amounts of student data that it can convert into a considerable amount of money.

Facebook has taught the world that data are fungible and can mean big money. They can also be very dangerous when controlled by an opaque organization immune to public oversight. Regardless of who is named the owner of student data in partner school contracts, as Summit Learning’s technology partner CZI has full access to those data.

Given this context it is concerning and suggestive to note that compared to the 2017 contract we reviewed, the 2018 partner school contracts we analyzed expanded Summit Learning’s (and thereby CZI’s) right to access and use de-identified student data.<sup>95</sup> Any use to which SPS, T.L.P. Education, or CZI may make of data that the Summit Learning Platform collects about students is independent of any benefit the Summit Learning Program may provide to its students. As we have already noted, the student data can be easily re-identified and there is a significant financial incentive to do so.

## **Privacy Concerns Meet Pedagogical Concerns**

It is important to understand that the algorithms governing the Summit Learning Platform’s curriculum delivery, data collection and analysis, and other efforts have been created via subjective decisions on the part of Summit Public Schools (SPS) (or Facebook’s or the Chan Zuckerberg Initiative’s) staff—and perhaps unknown others.<sup>96, 97</sup> Although algorithms are

commonly thought of as purely mathematical and objective, they are in fact theories that reflect which pieces of information their authors consider valuable and how their authors believe those pieces of information should be fit together and used to draw conclusions.

Therefore, all algorithms, including those in the Summit Learning Platform, necessarily reflect the values, assumptions, social positions, and interests of their authors. For this reason, researchers and advocates have called for algorithms to be audited for possible bias.<sup>98</sup> To date, SPS has not provided any information about the entities involved in making decisions about the Summit Learning Program’s curriculum and assessments or the qualifications of decision-makers; neither has it provided access to algorithms for disinterested experts to evaluate (See Appendix C).<sup>99</sup>

The transparency of the algorithms included in the Summit Learning Platform is essential to determine whether the inferences those algorithms draw about students are valid and to evaluate how they influence members of the school community to act in relation to students. SPS offers no such transparency.

Further, Summit Public Schools has presented the Summit Learning Program as amenable to customization to meet different communities’ varying values and needs. In reality, the Summit Learning Platform is centrally programmed with course content and with the algorithms that guide students’ experience and that make many consequential decisions about them. The proprietary curtain that keeps the Summit Learning Platform’s algorithms from review contrasts with the way in which, for instance, publishers commonly submit textbooks for review. It effectively turns school curriculum into a “black box” that operates with no oversight by or accountability to the public.

Marketing claims aside, there is little evidence that SPS’s program of curriculum and pedagogy either improves outcomes for students or personalizes instruction in ways that meaningfully distinguish it from any number of other educational programs. It is important to note that there are other ways to personalize education that do not require reliance on digital delivery or data collection. Alfie Kohn’s child-centered approach,<sup>100</sup> James Macdonald’s person-oriented curriculum,<sup>101</sup> and Lorrie Shepard and colleagues’ sociocultural approaches,<sup>102</sup> for example, focus on providing opportunities for children to create their own meaning from the curriculum.<sup>103</sup> As already noted, to a considerable degree the Summit Learning Program focuses on student development within a narrow pedagogical framework that emphasizes assessment and data collection. We know further that these data may be subsequently be transferred with virtually no transparency, oversight, or accountability to unknown, other parties.

## **Conclusion and Recommendations**

Despite many red flags and general lack of research support, advocacy for the adoption of digital personalized learning in general continues unabated. The Summit Learning Program is a slickly marketed digital personalized learning program that is promoted as a “free” and off-the-shelf program to schools all over the country. Our analysis suggests that, rhetoric notwithstanding, the Summit Learning Program does not deliver on its promise to provide

a higher quality education, with superior student outcomes, in the schools that adopt it. Moreover, aside from any valid education purpose, the Summit Learning Platform approach to assessment, coupled with enabling contract language, opens the door to the transfer of large amounts of student data to third parties without oversight or accountability. These concerns are compounded by the overall lack of organizational transparency of Summit Public Schools (SPS) and T.L.P. Education.

The rapid spread of the Summit Learning Program—despite a lack of transparency and the absence of convincing evidence that it can deliver on its promises—provides a powerful example of how policymakers are challenged when faced with a well-financed and self-interested push for schools to adopt digital personalized learning programs. There is now an urgent need for policymakers to move quickly to protect the public interest by establishing oversight and accountability mechanisms related to digital platforms and personalized learning programs.

We recommend that state departments of education establish an independent governmental entity responsible for implementing and enforcing the following recommendations to ensure the quality of digital personalized learning in schools and to adequately protect the privacy of student data. Specifically, such an entity should:

- Require that the digital personalized learning programs be externally reviewed and approved by independent third-party education experts. As part of these program evaluations, the evaluators should review and approve the program curricular materials, the pedagogical approaches as applied to the intended student populations, the validity of the assessment instruments, and the programmatic usefulness of data generated;
- Require that the assumptions and programming of all algorithms associated with personalized learning materials be audited for bias and other possible risks to students *before* the algorithms are implemented; and
- Develop a standard data security agreement that protects the privacy and limits the use of all data, including de-identified data, collected by schools through personalized learning materials and related software platforms. This agreement should require that the school collecting data do the following:
  - Clearly explain what kinds of data it proposes to collect from students, how it proposes to store the data and for how long, who will be allowed access, and what educational purpose all data collected will serve;
  - Refrain from collecting any data not directly relevant to an agreed-upon specified educational purpose and from using any data, including de-identified data, collected for any purpose other than the agreed-upon specified educational purpose;
  - Vest the ownership of any and all student data collected with the student or the adult(s) legally responsible for him or her;
  - Prohibit any school from making participation in its curriculum and instruction, assessment, or any other part of its academic program contingent on students or

parents granting any third-party access to their data in any form whatsoever;

- Provide a standard, explicit, and easy-to-understand explanation of what kind of data use is incorporated in such activities as “improving” websites, apps, or services, or in “personalizing and improving” users’ experience with educational software, and allow students to opt in to such activities;
- Prohibit schools from entering into any agreement with a third party that abridges any of the previously stated requirements.

Additionally, as a result of the problems we identified in our study of Summit Public Schools and its Summit Learning Program, we recommend that state, district, and school-level officials considering personalized learning be especially cautious about adopting commercially produced personalized learning programs. To avoid introducing significant pedagogical and privacy threats to their schools, we recommend that their first steps be to:

- Define the pedagogical values, goals, and practices they hope to achieve via personalized learning before considering the adoption of a particular program;
- Clarify the ways in which an ideal personalized learning approach would advance their self-defined values, goals, and practices;
- Identify potential negative consequences that may be associated with personalized learning and devise strategies for avoiding them;
- Determine which of their defined values, goals, and practices can be best achieved by non-digital means and which require digital means;
- Use the steps enumerated above either as a framework for designing their own personalized learning program or for assessing the suitability of any commercially provided programs being considered.

- 16 Students in the schools defined as “personalized learning schools” showed greater growth in math and reading scores on the Northwest Evaluation Association’s (NWEA) Measures of Academic Progress (MAP) assessment than the national average, and more than 50% of the students from these schools showed greater growth than “virtual students” created to serve as comparison standards.

NWEA (formerly the Northwest Evaluation Association) is a testing company based in Oregon. Its MAP Growth tests use “adaptive” algorithms to begin with a question appropriate for a student’s grade level and then choose subsequent questions throughout the test in response to student responses. For more information on NWEA and MAP Growth, see:

NWEA (2018). MAP Growth [webpage]. Retrieved June 3, 2020, from <https://www.nwea.org/map-growth/>

37 Summit Public Schools (SPS) funded two Harvard University researchers in 2016-2017 to develop a proposal for a comprehensive evaluation study, but ultimately rejected their proposal, citing the possibility that doing an evaluation study might burden teachers or preclude changes to the platform. It has not provided records we requested about the decisions to solicit and then not go forward with the proposed research, nor has it provided records we requested of any research reports in its possession that evaluates SPS outcomes. This information was requested from SPS in a California Public Records Act (PRA) request submitted on November 5, 2019. See Appendix C for all correspondence related to this PRA request.

- 42 The California Department of Education (CDE) reports a measure of "College/Career Readiness." CDE reports the measure as an indicator of "the number of high school graduates who are prepared for college or a career" and it defines readiness as "completing rigorous coursework, passing challenging exams, or receiving a state seal." CDE uses the college/career indicator to assign graduating high schools' students to one of the following three categories: "Prepared," "Approaching Prepared," or "Not Prepared."

Summit Learning (2019, April). *Cognitive skills rubric*. Retrieved June 3, 2020, from <https://cdn.summitlearning.org/assets/marketing/Cognitive-Skills-Document-Suite.pdf>

- 52 Stanford University’s Center for Assessment, Learning, and Equity (SCALE) worked with Summit Public Schools (SPS) on its Cognitive Skills Rubric. The SCALE website lists June 2014 as the “anticipated” completion date of that project. According to SPS’s *Research Roundup September 2017*, SCALE also worked with Summit on additional research that led to changes to the Cognitive Skills Rubric made in 2017. And according to the Cognitive Skills Rubric document we retrieved in June 2020, SCALE worked with SPS to create the most recent version of the rubric. When we contacted SCALE in August 2019, Research & Design Associate Laura Gutman told us that its staff wrote the rubrics and “benchmarked the levels to grade level standards.” When we asked for documentation that explains how the rubrics were created and benchmarked to grade level standards, she referred us to SPS, explaining that the project had been done several years prior, that the lead staff who had consulted on it were no longer at SCALE, and that she could not find any additional information to share with us at that time. Two versions of the rubric that we found (one dated May 2017 and the other dated April 2019) contain almost exactly the same categories, but there are

some differences in the skills detailed.

- 67 We found \$177,698,848 in grants in public sources, which is likely to be an underestimate (for details, see Appendix A). We requested records of funding from Summit Public Schools in a California Public Records Act (PRA) request submitted on November 5, 2019. Although Summit Public Schools responded that it would provide those records, as of June 8, 2020, it had not yet provided them. See Appendix C for all correspondence related to this PRA request.

- 68 Tara Mathewson told Christopher Saldaña that CZI provided her with this number. The term “committed” is unclear. It may be that CZI provided some funds before 2018 (its website reports grants beginning in 2018). It is also possible that the use of “committed” implies that they have planned to provide up to this amount in the future.

- 85 Stanford University professor Larry Cuban reported observing a strong "connective tissue" between Summit Public Schools (SPS) teachers and students, with teachers who were readily available and engaged in meaningful, competent interactions with students about both academic and personal matters, and mentors who were much more than typical homeroom teachers. He also expressed concerns about SPS's ability to "scale" its culture to partner schools.

- 87 Like the 2018 contracts signed with Summit Public Schools, the data privacy addendum applicable to new contracts with T.L.P. Education includes, in clause 4.5, “De-Identified Data may be used for any lawful purpose including, but not limited to, operating and improving the Services. Summit Learning’s use of such De-Identified Data shall survive termination of this Data Privacy Addendum or any request by Partner School to return or destroy Student Data. Summit Learning agrees not to attempt or have any third party attempt to re-identify De-Identified Data except for the sole purpose of validating Summit Learning’s de-identification processes.” Clause 4.6 provides for (personally identifiable) student data to be de-identified as a means of “destroying” it, and exempts de-identified data from the obligation to destroy data.

Summit Learning Program Agreement, Summit Public Schools and Fairview Park City School District, May 1, 2018 (Data Privacy Addendum, clauses 4.5, 4.6, 5.1b).

Summit Learning Program Agreement, Summit Public Schools and Wellington Unified School District 353, March 30, 2018 (Data Privacy Addendum, clauses 4.5, 4.6, 5.1b).

We consulted with Frauke Kreuter (Professor in the Joint Program in Survey Methodology at the University of Maryland; Professor of Statistics and Methodology at the University of Mannheim; and head of the Statistical Methods Research Department at the Institute for Employment Research (IAB) in Nürnberg, Germany). She explained that, “de-identification is an outdated concept in the modern data world” because “it’s not enough to talk about removal of PII [personally identifiable information] without having a clear idea of the data being in a safe place with safe people and a safe project” (because of the ease with which data can be re-identified by combining datasets). Contracts with Summit Public Schools (and now T.L.P. Education) allow de-identified data to be used, in perpetuity, “for any lawful purpose,” with no requirement to establish these features that would make the data environment safe from possible re-identification.

Kreuter, F. (2019, September 4). Personal communication (telephone) with Faith Boninger.

- 95 The 2017 contract signed with New Egypt High School limits Summit Public Schools' use of "de-identified" student data to "product development, research, or other purposes related to developing or improving the Program" and to demonstrations of "the effectiveness of Summit's products or services, including in its marketing" (clause 6k). The clause entitled "Destruction of Student Data" provided that "Summit will ensure that all Student Data in its possession...are destroyed at the direction of Partner School when Student Data is no longer needed for its specified purpose..." (clause 6j). In contrast, the Data Privacy Addendum to the 2018 contracts signed with the Fairview Park City School District and with the Wellington Unified School District 353 provides that "De-Identified Data may be used for any lawful purpose including, but not limited to, operating and improving the Service" (Data Privacy Addendum clause 4.5). The clause entitled "Destruction of Student Data" (Data Privacy Addendum clause 5.1b) refers to another clause entitled "Disposition of Student Data," (Data Privacy Addendum clause 4.6) which explains that one way Summit Public Schools may "dispose" of student data is to de-identify it. Further, "the duty to dispose of Student Data shall not extend to data that has been De-Identified" (Data Privacy Addendum clause 4.6). In other words, "destroy" in 2017 became "dispose" in 2018, and "dispose" does not require Summit Public Schools to give up the data—ever. Both the 2017 and 2018 contracts allow Summit Public Schools to continue to use de-identified data, for the purposes specified in each contract, into perpetuity (clause 6k in the 2017 contract; clause 4.5 of the Data Privacy Addendum to the 2018 contracts). The data privacy addendum we accessed from the Summit Learning website's "Privacy Center" on February 26, 2020 (i.e., that is ostensibly being used in contracts signed in 2020) contains the same wording as the 2018 contracts.

Summit Learning Program Agreement, Summit Public Schools and Fairview Park City School District, May 1, 2018 (Data Privacy Addendum, clauses 4.5, 4.6, 5.1b).

Summit Learning Program Participation Agreement, Summit Public Schools and New Egypt High School, May 11, 2017 (clauses 6j and 6k).

Summit Learning Program Agreement, Summit Public Schools and Wellington Unified School District 353, March 30, 2018 (Data Privacy Addendum, clauses 4.5, 4.6, 5.1b).

- 96 An example of a subjective decision made by unknown decision-makers is the decision to change the grading structure and add flexibility such that schools can vary the grading structure by course. Before 2019-2020, "cognitive skills" in non-math courses were weighted at 70% of the grade and "content knowledge" was weighted at 30% of the grade. For 2019-2020, Summit awarded schools the option to vary the weights in order to reduce the weight on content knowledge. It also changed the default weights for non-math classes to 80% Projects and 20% Content (with Power Focus Areas counting for 14% of the 20% and Additional Focus Areas counting for 6%), In math courses, the 2019-2020 default weights are 70% for Concept Units, 10% for Portfolio Problems, and 20% for "content knowledge" (14% for Power Focus Areas and 6% for Additional Focus Areas). These decisions were written into the algorithms that calculate grades and govern what school administrators are allowed to change.

- 98 Current efforts include the following: The American Civil Liberties Union, together with researchers from business and academia, founded the AI Now Initiative, a project to “identify and highlight” algorithmic bias. The German advocacy organization AlgorithmWatch analyzes the effects of algorithmic decision-making processes on human behavior and identifies ethical conflicts. Cathy O’Neil, who detailed the problems with algorithms in *Weapons of Mass Destruction*, founded a company to audit algorithms for companies concerned about the possibility of bias. She has not attracted many clients, and told *Technology Review* that “even those who know their algorithms are at a risk of bias are more interested in the bottom line than in rooting out bias.”
